factors that establish reviewer trustworthiness. Frustrating! In this situation, a quick lesson in
getting your dishwasher back on could prove vital. We, nonetheless always encourage homeowners
to use our professional Bosch dishwasher experts for all their repairs. We don't want you making
things worse by trying to carry out repairs on your own. Hence, it is essential to be equipped with
some basic knowledge of what you can do if your dishwasher won't start. The subsequent are a few
recommended actions to take For them to operate, they must be receiving power, and hence the

power knob should be on. If the power is on yet the Bosch dishwasher won't turn on, you should confirm that the installed fuses and power breaker are working.<http://www.kantoromega.pl/userfiles/compare-manual-and-computerised-system.xml>

If you are uncomfortable checking on connectivity, then you can contact a licensed technician to check this out for you. This is because, under many circumstances, dishwashers are connected to the home's electrical wiring hence it may be tricky to confirm power availability if you don't know where and when to touch the cables. You should, therefore, be very careful when checking the wiring. If you do not have the skill and experience to make appliance repairs then please call a professional dishwasher repair engineer. The door latches are usually fitted with switches that are designed to control the device when a door is opened. What they do is that they turn off the machine whenever the door is opened. Therefore, to have your dishwasher working, you need to disarm the switch altogether. This is achieved by ensuring the door is closed firmly hence activating the door latch. If, it is open, it will not work due to the switch. Due to being exposed to water over a long time, the terminals may become corroded. When this happens, it will deter a proper electrical connection hence affecting the turning on of the dishwasher. It is, therefore, necessary to check on these terminals to see whether they are getting corroded to avoid such challenges. You should ensure the door latch is well mated to the catch. If it is not, then your Bosch dishwasher will not turn on. This is because the machine will consider itself open and remember it can only work when the door latch is tightly closed. It is easy to check whether the door latch is well fitted to the catch by using the Ohm Meter. This will help you confirm whether or not there are closed circuits. However, remember to turn off power from source first when doing this. Also, ensure you have removed the wires that may be passing current at the switch terminal. This is because it determines and controls the power that is required in every compartment.

This means if you have a faulty timer, there would be an inadequate distribution of power to the various chambers of the machine. This could lead to the device not turning on and also result in so many other challenges that may be related to electronic control. Ensure to check this out. This could be to wash the utensils, dry them or even rinse or adjust the temperatures. If your device is not turning on, you can do a random check with the cycle selector just to confirm that it is not stuck in the machine settings. If you are using a model that uses buttons, this may be a widespread occurrence, and hence you should be keen to check and confirm that only one button is pressed at a time. If this happens, check out the motor. Ensure it doesn't have clogged materials preventing the dishwasher from starting. You can do this by checking underneath the pump cover and the filter assembly. A Bosch dishwashing machine repair expert will troubleshoot and determine the real problem. Then they will get it sorted. If you need to speak to a reputable technician, get in touch with Repair Aid dishwasher repair experts, we are here to help. I noticed water coming through on the inside from a vent in the left corner and then filling the inside causing the float to activate and the check water light to come on. I decided to take the side of to take a look and what I did notice is that the plastic casing that contains the water was already full. So when the cycle started the inlet kept sending in water and the plastic casing sends the water into an overflow chamber which routes to a circular grill inside the left of the dishwasher as mentioned above which is causing it to flood and the check water light to come on. For some reason even resetting the machine drains the water from the inside but not from the side chambers where it is stored. Im not sure where the fault lies here, from other research it suggested an impeller jug but my dishwasher does not have that, it does however have a little wheel that spins around as the water comes in through the inlet which is attached to some sort of reed switch. Any help would be most appreciated as I think this can be a simple fix hopefullyI found a replacement fairly cheap as suggested so have ordered it hoping it fixes the issue. Im not sure what Im looking at in all honesty, its the plastic casing that is exposed when you take the left hand cover off with all the pumps etc.The water inside the softener chamber on the inside is only partially full. One question on the reed switch, it looks like this can just be pulled out of the plastic holder. Do I need to replace it with the whole casing or can I just take the small pcb out and replace Thanks!As soon as it tried to take water in, it tripped the switch and used the existing water in the plastic tank and started running the cycle. Fantastic, its now working as expected. Thank you for your help kind sir.

The model takes into account factors including the age of a rating, whether the ratings are from verified purchasers and factors that establish reviewer trustworthiness. How

can I test to determine if it is the pump or clogged line. Also, where can I get a user manual online to look at So that I can find the manual for you..The dishwasher is great in all aspects except I do not know how to disable the beeping alarm at the end of a cycle.

It continues to beep for hours on end until the door is opened. Does anyone know how to disable the alarm Thanks, Please help One is obviously the drain coming from the back of the unit, and the other is attached to the side looped and not connected to anything. I went online to the Bosch website for a installation manual and it describes this hose as a air venting hose. Does the end attach anywhere or does it just hang loose on the unit. My husband detached it from its original position and thought it was part of the water line. HELP! When water flows through the drain.SHU43 Bultin Dishwasher Im told that it is several years old. Hold times are long. If the door switch is defective, the switch will prevent the dishwasher from running even when the door is closed. To determine if the door switch is at fault, use a multimeter to test the switch for continuity. If the switch does not have continuity, replace it. Required Part Dishwasher Door Switch Enter model number to search for the required part specific to your product Browse our parts categories to select from a variety of parts for your product SHOP PARTS Most Common Solution 02 Thermal Fuse The thermal fuse shuts off power to the dishwasher if it overheats. If the thermal fuse blows, it will prevent the dishwasher from starting. To determine if the thermal fuse is defective, use a multimeter to test the fuse for continuity. If the thermal fuse does not have continuity, replace it. Required Part Dishwasher Thermal Fuse Enter model number to search for the required part specific to your product Browse our parts categories to select from a variety of parts for your product SHOP PARTS Most Common Solution 03 Door Latch The door latch ensures that the dishwasher door latches shut. If the door does not latch properly, the door switch might prevent the dishwasher from running. If the door latch is broken, replace it.

Required Part Dishwasher Door Latch Enter model number to search for the required part specific to your product Browse our parts categories to select from a variety of parts for your product SHOP PARTS Most Common Solution 04 Main Control Board The main control board provides power to nearly every component of the dishwasher. If there is a problem with the main control board, it might not send voltage to the dishwasher, causing the dishwasher not to start. Control boards are often misdiagnosed—make sure you check more commonly defective parts before replacing the main control board. Required Part Dishwasher Main Control Board Enter model number to search for the required part specific to your product Browse our parts categories to select from a variety of parts for your product SHOP PARTS Most Common Solution 05 Touchpad To determine if the touchpad is at fault, try pressing various buttons on the touchpad. If some of the buttons don't respond, the touchpad might be defective. If the touchpad isn't working properly, replace it. Some manufacturers sell the touchpad separately from the control panel. Other manufacturers require that you purchase the touchpad and control panel together. If you cannot replace the touchpad individually, replace the touchpad and control panel. Required Part Dishwasher Touchpad Enter model number to search for the required part specific to your product Browse our parts categories to select from a variety of parts for your product SHOP PARTS Common Solution 06 Touchpad and Control Panel To determine if the touchpad is at fault, try pressing various buttons on the touchpad. If some of the buttons don't respond, the touchpad might be defective. Some manufacturers sell the touchpad separately from the control panel. If you cannot replace the touchpad individually, replace the touchpad and control panel.

UserFriendly Manuals. Product Instructions. If your dishwasher model was released annually to the same hype as most mobile phones are every year, the release date would be ingrained in your memory even if youre not a fan of that particular model and never planned to get one. It is also handy to know the year for insurance purposes. This information will come in handy if you need to buy any spare parts or, again, if your dishwasher develops a fault and needs to be serviced. Inside the door or on the side panel of your dishwasher, you will find strings of numbers and letters hopefully still legible after years of use. One of these numbers is beginning with the letters FD. This is the serial number youre looking for. Ignore all these number but the first four. The last two digits represent the month. The production month is February. In that case, ignore the first digit, giving you the year 02 2002 and the month 05 May. She writes about education, parenting and linguistic technology. Find her at www.tanyamoziasslavin.com. You must have JavaScript enabled in your browser to utilize the functionality of this website.

Slimline Dishwashers Dishdrawers Double Dishdrawers Integrated Dishwashers Full Width Integrated Dishwashers Slimline Integrated Dishwashers Once we have checked it to make sure it is still brand new and can be sold as brand new we will refund you in full. However, on occasion damages will happen. Please upgrade your browser to improve your experience. You can choose whether to manage these or allow them all. View Cookie Policy. I have the SGU53E15AU model and it is already acting up. Ive checked the filters, pipes and connections all are fine. I have tilted the unit on its side to drain any excess water as per what everyone online appears to have done. Any one else had this issue I have found them to be very helpful. I assumed the Bosch call centre would just be admin staff, is this not the case Bosch were very helpful and fixed it for free. Unfortunately its after hours for the help line. I havent even managed to get 1 cycle through yet.Its a bit of a pain when you work during the hours they are available. Bosch organised a local service company Mr Dishwasher to come out and fix it. It connects to the control board. If it doesnt spin the dishwasher doesnt know when its full, until it hits the safety float switch. This is a bit different to older dishwashers which use a pressure switch to measure water depth rising in a plastic hose. But then a few mths later it did the same thing. So were informed that would not be covered under warranty. Anyone had the back off. Looks like a special kind of tool. Turn it 90 degrees and tip backwards as far as you can and give it a little shake. There is a little float that gets stuck and this releases it. I first tried tiltng it but no luck. Then I cleaned everything no luck. Then I unscrewed the left hand side. I saw the water was pumping around nicely but something inside wasnt working. Disconnected the water inlet and unclipped the white plastic inlet plate.

I disconnected it off and realised it has a spinning part inside so I blew into it to clear any debris. I set a quick wash and it worked fine. Blowing into the part seemed to give it a kick start so try that if all else fails as I managed to fix it for free. The unit would be used maybe twice weekly sometimes less. Then two weeks back the unit would not complete the cycle with a light on “Check water” From other comments on the forum which have now been removed this problem has with this particular Bosch unit it has been happening for sometime. Even so far back to when I purchased the dishwasher. Seeing the comments have been removed has anyone had success with rectification. There were quite a number of complaints posted on the forum and I wonder how many others have had issue without posting. I will be calling Bosch Monday and I know what they’ll say its out of warrantee and its my problem. That will not be good enough a product should go for some years before faults creep in to play. I also have a frontloader washing machine purchased a few months earlier than the dishwasher with no problems. If flashing, needs a service call. If solid you check the filter on the end of the water inlet hose, filter inside the unit and drain hose for blockages. You can also try turning

the water tap to either increase or decrease the water pressure so that its about half way. If you contact Bosch please mention to them that you purchased Bosch because it was a quality product and you want the unit looked at under warranty. Discuss your rights under the Australian Consumer Law. Bosch really didnt want to know about the problem and was palmed off to a repairer NOT GOOD So my wife googled and found a couple of suggestions. Turned out that the problem was a stuck water pump due to a sliver of chicken bone caught in the impeller. The issue turned out to be a blocked drain pipe where food waste had stuck in the end of the hose where it connects to the under sink waste water pipe.

Removed dishwasher from kitchen cavity, have to remove 2 side screws and wind up support legs for dishwasher to slide out. Removed internal filters and rinsed. Tipped dishwasher on side and then on front left for 10 minutes, ran dishwasher on empty and worked. Replaced dishwasher ran on empty with white vinegar in powder trays, at the moment working. This might not be the problem for everyones check water light issues but it certainly was ours and our dishes are being cleaned properly again. Winning! I unplug the machine and take the side off, the opposite side to power cord, there is a hex screw under the plastic trim low down on the front edge of the side panel. I run the machine without dishes or draws with the side off, i tap the float, and it clears the gunk a little. I would love to know of any tricks to flush that float. I dont want to have to unscrew the plastic moulded float tank or try and flush it through the waste pipe. Looks like known issue in bosch. Called the support but they want read the manual. No much help. Will try some of the fixes in this thread. Is this a maintenance issue or design flaw We had been invaded by German cockroaches. Most of the dishwasher was still functioning. Indeed, 3 or so litres of water, added by me by jug, to test, would happily pump from the machine after each reset. I knew there was nothing awry with the sump, or discharge bits. It came without some pieces repair man had failed to reassemble correctly, but was largely in tact, and in lovely clean condition. I was worried as the part numbers on aquastop hoses were slightly different to mine. Some come complete with the water wheel housing same price. The incoming water drives an impeller and the sensor contacts were dirty due to cockroaches. Easy fix if you know what to do. It is working fine again. I have had a number of errors over its life all have been associated with dirty filters or an impeded waste pump impeller.
