Book Descriptions:

We have made it easy for you to find a PDF Ebooks without any digging. And by having access to our ebooks online or by storing it on your computer, you have convenient answers with britony combi boiler se manual . To get started finding britony combi boiler se manual , you are right to find our website which has a comprehensive collection of manuals listed.

Our library is the biggest of these that have literally hundreds of thousands of different products represented.

Book Descriptions:

britony combi boiler se manual

Pressure Switch 5. Ignition Electrodes the gas and electrical supplies. Isolate Carry out steps 1 and 2 as above. Remove the 2 Drain the boiler as in step 12. Open the Remove the casing as step 1 unscrew four self tapping screws securing the sea clips on the 3 way valve hydraulic motor electrical box cover removing the 2 led chamber front panel. CODE FAULT Overheat sensor switch open. Overheating defect without lock out. Antifrost mode on pump in operation. Antifrost mode on burner and pump in operation. Turned the boiler on, but theres loads of air in. The boiler still ignites, but much the same as before stops and starts. Now, I realise all the air should be out of the boiler first. But, as theres no manual to refer to, is this boiler selfbleeding. Ive run it for 30 mins. Once, the pressure dropped to zero, so I presume that was air being vented. I left it to cool for an hour, and repressurised. Its still full of air. So, I have 2 questions 1, Does the previous intermittent firing sound like the 3 way valve and has she wasted 60 2, How do you bleed the boiler, if needed. Thanks in advance. Diverter valves on this boiler are prone to failure, so chances are it will be useful one day. The boiler has an AAV automatic air vent above and behind the pump. Providing the small red plastic cap on it is open, it should vent the air. You probably need to find a boiler engineer who understands how the Britony works. The best manual for this boiler is the manual for the Baxi Genesis which is virtually the same boiler try the Partsarena site. <http://www.lacavenormande.fr/userfiles/20200913102936.xml>

A further development The guy she bought the house from says he had the same problem. An engineer changed two thermistors at a cost of about 20. He showed him how the old ones had scaled up. Problem solved. Once I get hold of a manual, Ill find and change them again. Fingers crossed. Click to expand. I read your post and meant, once I get hold of a manual from the partsarena site. Been there and found the info I needed. Thanks for that. The boiler still doesnt work after changing the 3 way valve, bleeding the boiler as you suggested and checking the thermistors for scaling still looked like new. The pump runs constantly, and the boiler still tries to fire up intermittently. I swapped the wires over to the 2 thermistors, and it worked a treat, until the boiler didnt stop boiling and made a noise like a jet taking off. After Id ducked a bit, I checked the wiring diagram to make sure and put them back onto their correct thermistors. The friend is adamant that the 3 way valve was the problem, and after 16 years in the trade, he says he knows what hes talking about. Decided to call in British Gas and pay them the 132 to sort it out. Ill let you know when theyve been if I am that idiot or if the egg is on someone elses face. My daughters still 60 out of pocket, plus the British Gas charges. I suppose theres a moral in there somewhere The fault was nothing to do with the 3 way valve. They found the flowpressure valve faulty. This possibly caused one thermistor to go out of calibration. So much for my visual check of the thermistors They changed both parts and all was at

peace with the world. Less than an hour, including paperwork. Great service and great result. No, before you ask, Im with NPower All for a measly 132 allinclusive charge. Thought Id let you know in case anyone else has a similar problem. Click to expand. Sounds like the basic problem was the air in the system. Was the auto air vent screwed

shut.<http://www.santaclaradistribuidora.com.br/admin/fckeditor/uploads/cub-cadet-manuals-zero-tur-n.xml>

The CH flow switch should have stopped the boiler if it was low on water. By the way the different looking Chaff Instrs are at I may have got the name wrong. They changed the complete part and the corresponding thermister. All I know is, it worked when theyd done. And I watched them. Plus, its not really in their interests to tell me porkys, is it. They dont get any more money for it. No, the pressure was fine and the system quiet once I vented the air as instructed previously with the AAV. The AAV It has a red cap. The cap was screwed down. I unscrewed the cap, vented the air, and rescrewed the cap down. Are you saying the cap should be left permanently unscrewed to vent the air. Either way, if it was purely air in the system, once Id vented the air, the boiler should have fired, no. And, the boiler didnt fire in either hot water or ch mode. I know for a fact the red cap has never been touched before the problem started. I dont mean to sound like Im arguing, cos I dont know enough about boilers to be able to argue. Im just stating the facts, and the questions they raise in my mind. Im grateful for any help and advice anyone ever gives me. No Im not arguing, Im just interested to know what the problem was and there isnt a part with a name anything like you were told. Inside part 9 theres a switch which detects the flow of water boiler side. What happens is that the pump has nothing to pump except air, and the water cant get out of the boiler so it boils jet engine noises!. If it 9 was sticking generally, it could also have been what stopped the boiler firing when there was water flowing. Its a straightforward bit to diagnose, being electrical. With the thermistor, about 30, must put my prices up!They listed the 2 parts on there. They had to fill in the cost of the parts, and they said they were about 60 Ill reply in a couple of days. You can create your listing free at DIYnot Local. The Main Combi 24 HE is a fully automatic gas fired wall mounted condensing.

Weve had an engineer out this week to service the boiler and diagnose the faults and hes come back with that it needs a new 3 way valve motor but nothing about the PCB. Would it be advisable to have the PCB replaced at the same time as the motor given the recurrent problem rather than pay out two sets of call out fees or could the stuck valve also cause the above error code in some way. If money were no object wed probably replace the boiler but that isnt really an option at the moment. Thanks in advance for any comments. Dave.I think the cost of the PCB itself is around 115120 pounds.

<http://superbia.lgbt/flotaganis/1649213638>

I've found the Operating Manual I think if it's useful at all. However, the company we used for the servicing has given quite a high quote for the PCB and slightly above the upper end of the price range we've found online. We've not been overly impressed with them so far, mostly v. poor communication at every stage, and not very competitive so we will be getting some more quotes. Please upgrade your browser to improve your experience. I have a Chaffateaux and Maury Britony Combi SE boiler which has broken down. According to the flashing lights on the front, the problem is no flame detection. I called British Gas for a one-off repair who recommended I spread the cost and take out a maintenance contract with them. Of course, I thought it would be easier on my wallet not having to pay them a lump sum so took them up on the offer. The engineer came to my house, said that the boiler wasn't on their Service list, that it could be a number of things that are wrong: PCB Board, electrode or the leads that connect the two, and that it would take two weeks to get the relevant parts, meaning British Gas couldn't touch it and wouldn't be able to offer me a maintenance contract after all. He then left. I called a local guy but he told me I actually needed a new gas valve. That he would make some calls to try and find one and get back to me that day but never did. After chasing him 3 times over 3 days with no response, I gave up. Managed to find a PCB Board myself from a great local company but because they're so highly recommended they're very busy and can't actually fit it for 3 weeks!!!! Like everyone in this situation, I'm having a nightmare trying to sort this out and am hoping I can call someone up, tell them the problem, give them the part and all will be well hopefully. Also, did this fix the problem. I have the same boiler and it comes up with the same error code 60.

<http://curabona.com/images/commercial-manual-floor-sweeper.pdf>

A local plumber tried what he said was a new board, though it looked pretty tatty in the box it came in, but I still had the intermittent fault. He then changed a pressure valve and eased me of 160, however I still have the intermittent fault. I can buy a new board but am not convinced it will fix the problem, but as my plumber didn't really have a clue, I can't see the point in getting him back. I reckon I can change the board for the cost of a plumber coming back to not fix the problem. ML And guess what? The damn thing has packed in again, only this time I can get hot water but no heating so the valve has stuck the opposite way this time. So looks like to try and locate another valve and spend another hour or so on my back replacing it. So if anyone is having a problem, try both hot water and heating separately and if the flames go out on either one, it stands a good chance it is the valve which is on the left behind the drop-down plastic panel. You will see a sensor on the front with 2 purple wires coming from it. The main control for the valve is at the back where there is a plug with 6 or 8 wires on it, but good luck coz it's a pig to swap out. Any help appreciated. Both faults are common. Have you tried power cycling to see if the boiler will reset? I downloaded an installation and user manual some months ago but can't see how to adjust the bath tap flow rate. I have worked out that is probably why the water temp. If I run the cold tap in the kitchen or anywhere else for that matter, the bath tap water temp. Thanks for any help. If so, you can reclaim the tax on it.
